

The power of the sea

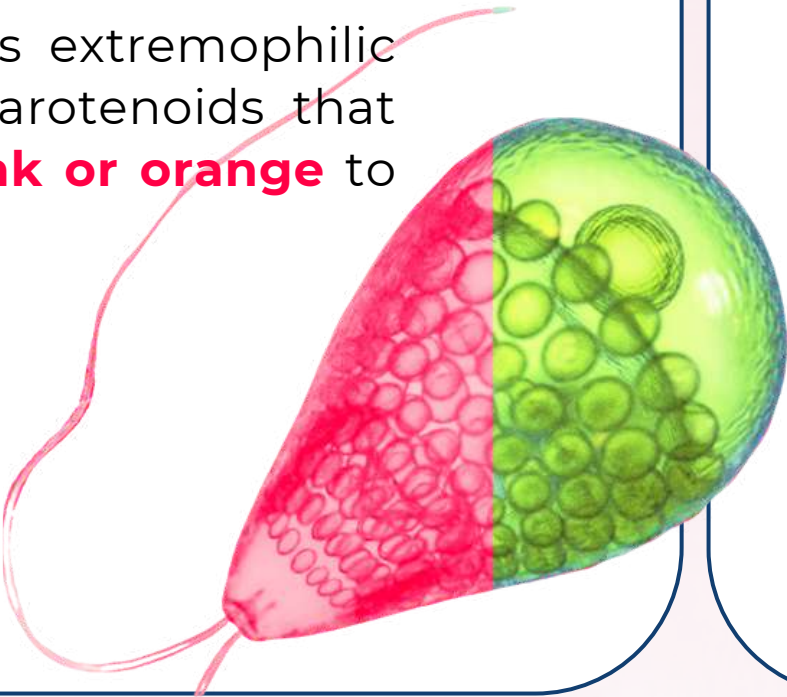

DUNALINA

Dunaliella salina is a green microalgae from the Mediterranean Sea, which stands out for its impressive capacity to adapt to environments of hypersalinity (up to 35%) and luminosity.

As a reaction to these extreme conditions, this extremophilic microalgae produces high concentrations of carotenoids that cause it to change color from green to red, pink or orange to intense.

This active ingredient is obtained by a green extraction method: extraction by microwave, without solvents and preserving the properties of the cell thanks to a controlled low temperature.

COSMOS
